

Clinics System:

Their already in use system doesn't have reservation system, so we will add this feature to our system

Steps for the patient:

1st step: The patient takes a coupon from the reception after taking his data to send it to the dedicated clinic (all clinics are connected to the same system)

In our system: Patient will have the option to view all the clinics with their schedules from the application and make an appointment but first he should enter his data to save it in the system

2nd step: Patient goes to the nurse before the clinic to record his initial vital signs then it goes to the dedicated clinic to the doctor to see them and add them to the system

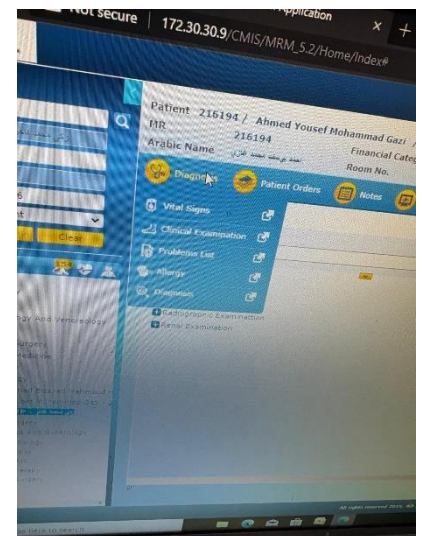

Note: If the patient has any past visits to the hospital before his dedicated doctor will see all the past data about this patient (old diagnosis and prescription)

3rd step: In their systems, doctors should add the patient vital signs, then add the patients' complains in the problem list, see all the patient allergies then he should add the final patient diagnosis.

If the patient needs any clinical examinations, doctor should list all the examinations needed then it will be passed to the hospitals' Laboratories.

Same for the medications, the doctor should add the prescription in the system and it should be passed to the pharmacy.

All these data will be added to the patients' medical sheet so that the patient can view them later or doctors in the next visit

4th step: Doctor should see the patient case if its sever we could admit him to the hospital

So patient will be passed to another department with same data but will have another sequence of steps.
