

scenarioUseCase Description

1) Manage Authentication

- UseCase Name: Manage Authentication
- Type: Primary / Essential
- Actors: Admin / Client / Freelancer / General Manager / Proposal Manager / Team Leader
- Description:
 1. User opens the platform.
 2. User selects “Login”.
 3. System displays login form.
 4. User enters:
 - Email
 - Password
 5. User clicks “Login”.
 6. System validates credentials.
 7. System checks user role.
 8. System grants access to corresponding dashboard:
 9. Client Dashboard
 10. Developer Dashboard
 11. Supervisor Dashboard
 12. Admin Dashboard
 13. User successfully logs into the system.
- Preconditions:
 - User has access to the platform.
 - System server and database are operational.
 - User has a registered account (for login).
 - User has internet connection.
 - User is not already logged in.

- **Postconditions:**

- User identity is verified.
- User session is created successfully.
- User gains access to the appropriate dashboard based on role.
- System records login activity.
- User can access authorized system features.

- **Cross Reference: R1, R2**

- **R1:** Unique Email Validation
- **R2:** Password Security Policy

- **Alternative Scenario**

- At step 6: System displays error message: "Invalid email or password."
 - At step 6:
 1. User selects "Register".
 2. System displays registration form.
 3. User enters:
 - Full name
 - Email
 - Password
 - Role
 4. User submits registration form.
 5. System validates entered data.
 6. System creates new account.
 7. System stores user information securely.
 8. System displays successful registration message.
-

2) Manage Client

- UseCase Name: Manage Client
- Type: Primary / Essential
- Actors: Admin / Client / Proposal Manager
- Description:
 1. Proposal Manager send a proposal to the client
 2. Clients approves the offer
 3. Client logs into the platform.
 4. Client opens the client dashboard.
 5. System displays available client features.
 6. Client selects one of the following actions:
 - View Project Progress
 - View Notifications
 - Track Milestones
 - Update Profile
 7. Client enters required project or profile information.
 8. System validates entered data.
 9. System stores or updates client information successfully.
 10. System updates dashboard information.
 11. Client receives confirmation message.
- Preconditions:
 - Client has a registered account.
 - Client is authenticated and logged into the system.
 - System server and database are operational.
 - Client has internet access.

- **Postconditions:**
 - Client information is stored or updated successfully.
 - Project request is recorded in the database.
 - Client dashboard reflects updated information.
 - Notifications and project tracking become available.
 - System logs client activity.
- **Cross Reference: R1, R2, R3, R4**
 - R1: Project Submission Management
 - R2: Project Progress Tracking
 - R3: Notification Management
 - R4: Client Profile Management

3) Order Project

- UseCase Name: Order Project
 - Type: Primary / Essential
 - Actors: Client / Freelancer
- 1) Client logs into the platform.
 - 2) Client submits a project request with required details.
 - 3) System stores the request and notifies the Proposal Manager.
 - 4) Proposal Manager reviews the client requirements.
 - 5) Proposal Manager prepares a project proposal including:
 - Estimated cost
 - Timeline
 - Required services
 - Project plan
 - 6) Proposal Manager sends the proposal to the client.
 - 7) Client reviews the proposal.
 - 8) Client chooses to approve or reject the proposal.
 - 9) If approved, the system creates the project officially.
 - 10) System starts the project workflow and task allocation process.

- **Preconditions:**

- Client has a registered account.
- Client is logged into the platform.
- Proposal Manager has access to project requests.
- System server and database are operational.
- Internet connection is available.

- **Postconditions:**

- Project request is stored successfully.
- Proposal is created and sent to the client.
- Client decision is recorded.
- Approved projects are added to the system.
- Task allocation process begins after approval.
- System records all project activities.

- **Cross Reference:**R1, R2, R3, R4

- R1: Project Request Management
- R2: Proposal Creation Management
- R3: Client Approval Process
- R4: Task Allocation System

- **Alternative Scenario**

- Client rejects the proposal.
- System records rejection status.
- Proposal Manager receives rejection notification.
- Proposal Manager may edit and resend proposal.

4) Manage Project

- UseCase Name: Manage Project
- Type: Primary / Essential
- Actors: Admin
- Description
 - 1) Developer logs into the platform.
 - 2) Developer opens the "My Tasks" or "Project Management" page.
 - 3) System displays a list of assigned tasks and their current status.
 - 4) Developer selects a specific task to update.
 - 5) Developer updates the task progress (e.g., "In Progress," "Completed").
 - 6) Developer adds notes or uploads completed deliverables if applicable.
 - 7) System records the update and completion time.
 - 8) System automatically updates the project dashboard for the Client and Supervisor.
 - 9) Supervisor receives a notification for tasks marked as "Completed".
 - 10) Supervisor reviews the deliverable for quality assurance.
 - 11) Supervisor approves the task or requests revisions.
 - 12) System updates the Developer's skill score based on the supervisor's evaluation of the work.
- Preconditions
 - Developer and Supervisor have registered accounts with appropriate roles.
 - The Project has been ordered and tasks have been automatically allocated.
 - Developer is assigned to at least one active task.
 - System server and database are operational.
- Postconditions
 - Task status is accurately updated in the database.
 - Project progress is reflected in real-time on the Client dashboard.
 - Quality control is verified through Supervisor approval.
 - Developer's dynamic skill score is updated based on performance.

- **Cross Reference: R1, R2, R3, R4**

- R1: Automated Task Allocation & Skill Scoring
- R2: Task Progress Tracking
- R3: Quality Control & Supervisor Review
- R4: Performance Evaluation

- **Alternative Scenarios**

At Step 11: Task Rejected by Supervisor

- Supervisor identifies that the deliverable does not meet quality standards.
- Supervisor marks the task as "Revision Required" and provides feedback.
- System notifies the Developer of the required changes.
- Developer updates the task and resubmits for review.

At Step 12: Evaluation Score Below Threshold

- System detects a low performance rating for the completed task.
 - System updates the Developer's skill score negatively.
 - System adjusts future task allocation to assign less critical tasks to this developer.
-

5) Manage Payment

- UseCase Name: Manage Payment
- Type: Primary / Essential
- Actors: Client / Administrator
- Description:
 1. Client logs into the platform.
 2. Client navigates to the "Payments" or "Billing" section for a specific project.
 3. System displays the project cost and payment status.
 4. Client selects a bank-based payment method.
 5. Client enters financial details and confirms the transaction.
 6. System securely processes the transaction through the payment gateway.
 7. System records the financial transaction in the database.
 8. Administrator monitors the transaction to ensure successful processing.
 9. Administrator updates and manages the balance of the assigned freelancers based on project milestones.
 10. System notifies the Client of a successful payment and updates the project status.
- Preconditions:
 - Client has a registered and authenticated account.
 - A project request has been submitted and the cost has been finalized.
 - System financial modules and external bank interfaces are operational.
 - Administrator has access to financial management tools.

- **Postconditions:**
 - Financial transaction is securely recorded and stored.
 - Project funding is confirmed, allowing the development workflow to continue.
 - Freelancer balances are updated and managed by the administrator.
 - The system maintains a high standard of data privacy and security throughout the process.
- **Cross Reference:** R1, R2, R3, R4
 - R1: Bank-based payment methods
 - R2: Secure financial transaction processing
 - R3: Administrator management of freelancer balances
 - R4: Security measures for user and project data
- **Alternative Scenarios:**

At Step 6: Payment Authorization Failure

- System detects a failure in the bank-based transaction (e.g., insufficient funds or incorrect details).
- System displays a payment error message to the Client.
- Client is prompted to retry with valid information or a different bank account.

At Step 8: Disputed Transaction

- Administrator identifies a discrepancy in the recorded transaction.
- Administrator suspends the project progress until the financial record is verified.
- System notifies both the Client and the assigned Developers of the temporary hold.

6) Manage Employee

- UseCase Name: Manage Employee
- Type: Primary / Essential
- Actors: Admin
- Description:
 1. Admin or Supervisor logs into the platform and navigates to the "Employee Management" section.
 2. System displays a list of all registered developers and staff members.
 3. Admin can create new user accounts for employees or deactivate existing ones.
 4. Admin manages system permissions and role-based access (e.g., promoting a Team Member to a Team Leader/Supervisor role).
 5. Supervisor views the dynamic skill scores of developers, which reflect their expertise in areas like backend, frontend, and UI/UX.
 6. Supervisor monitors the workload distribution to ensure tasks are balanced across the team.
 7. System tracks and displays developer performance history based on past project completions and reliability.
 8. Admin or Supervisor can suspend or ban accounts if policy violations are detected.
 9. System identifies the top five developers after each project to reward them with training courses.

- **Preconditions:**

- The actor is logged in with Admin or Supervisor privileges.
- Employee profiles and performance data are stored in the system database.
- The Developer Management Subsystem is fully operational.

- **Postconditions:**

- Employee account statuses and permissions are updated.
- Workload is optimized based on current developer availability and skill sets.
- Performance-based rewards and training opportunities are assigned to high-performing staff.

- **Cross Reference:**

- R1: Administrator management of user accounts.
- R2: Dynamic skill scoring system.
- R3: Fair workload distribution.
- R4: Reward system for top developers.
- R5: Account suspension/ban for policy violations.

- **Alternative Scenarios:**

At Step 8: Performance Score Drop

- System identifies that a developer's skill score has dropped below a specific threshold due to poor evaluations.
- Supervisor reviews the feedback and assigns the developer to less critical tasks for the next project cycle.

At Step 3: Bulk Account Migration

- Admin needs to update multiple employee roles simultaneously during a company restructuring.
- Admin uses the management interface to batch-update permissions.

7) Manage Training Centers

- UseCase Name: Manage Training Centers
- Type: Secondary / Support
- Actors: Admin
- Description:
 1. Administrator logs into the platform and navigates to the "Training Centers" management section.
 2. System displays a list of affiliated training centers and the courses they offer.
 3. Administrator adds or updates the profiles of training centers that provide professional development for freelancers.
 4. System identifies the top five developers based on the latest performance evaluation scores.
 5. Administrator assigns specific training courses from the centers to these top-performing freelancers as a reward.
 6. System sends a notification to the selected freelancers with details about their awarded training course.
 7. Administrator tracks the enrollment and completion status of these courses to ensure professional growth.
- Preconditions:
 - Administrator is logged in with appropriate permissions.
 - A project cycle has concluded, and developer performance evaluations are finalized.
 - Affiliated training centers are registered within the system.

- **Postconditions:**
 - The top five freelancers are successfully matched with relevant training courses.
 - Professional growth activities are recorded in the developer's performance history.
 - The system updates the list of available courses and partner centers as needed.
- **Cross Reference:**
 - R59: Reward system for the top five developers after each project.
 - R60: Support for continuous improvement through evaluation results.
 - Significance and Impact: Encouraging accountability and professional growth.
- **Alternative Scenarios:**

At Step 4: Tie in Performance Scores

- System identifies more than five developers with identical top scores.
- Administrator reviews secondary metrics, such as reliability or completion time, to select the final five recipients.
- System proceeds with the assignment for the selected developers.

At Step 5: Course Unavailability

- Administrator finds that a specific awarded course is no longer offered by the training center.
- Administrator selects an alternative course of equal value from a different training center.
- System updates the notification sent to the freelancer.

8) Manage Notification

- UseCase Name: Manage Notification
- Type: Secondary / Support
- Actors: Client / freelancer / Team leader / Administrator
- Description:
 1. User logs into the platform and accesses their notification settings or dashboard.
 2. System automatically generates alerts based on platform activities, such as:
 - New project request submissions (for Proposal Managers).
 - Task completion alerts for Clients to stay informed.
 - New task assignments for Developers.
 - Review requests for Supervisors once a task is marked as finalized.
 - User views the list of notifications which include specific task details or project IDs.
 3. User can mark notifications as read or clear them from the dashboard.
 4. System ensures real-time delivery of notifications to maintain transparency and accountability.
- Preconditions:
 - The User must have an active and authenticated account.
 - The Notification System must be operational and linked to the project database.
 - An event (such as task completion or assignment) must occur to trigger an alert.

- **Postconditions:**
 - Users are successfully informed of relevant project updates in real-time.
 - Communication gaps between clients and development teams are minimized.
 - System records the delivery and receipt of key project notifications.
- **Cross Reference: R1, R2**
 - R1: Notification System.
 - R2: Project Tracking Management.
- **Alternative Scenarios:**

At Step 2: Notification Delay

- System experiences a delay in processing real-time updates due to high traffic.
- System queues the notification and delivers it once resources are available to ensure reliability.

At Step 3: Invalid Link or Missing Details

- User attempts to open a task from a notification, but the task has been reassigned or deleted by an Admin.
- System displays an error message stating the information is no longer available.

9) Manage Reports

- UseCase Name: Manage Reports
 - Type: Secondary / Support
 - Actors: Admin / General Manager / Team Leader
- Description:
 1. Actor logs into the platform and navigates to the "Reporting Center."
 2. System provides options to generate two specific types of reports:
Project Progress Reports and Developer Performance Reports.
 3. For Project Progress Reports: * System aggregates data on project milestones, task completion statuses, and overall development progress.
 - Actor filters by Project ID or Client to view real-time visibility into specific workflows.
 4. For Developer Performance Reports:
 - System compiles data from the dynamic skill scoring system and historical evaluation results.
 - Actor reviews metrics such as work quality, completion time, and reliability across multiple projects.
 5. System generates a visual summary or a downloadable document containing the requested analytics.
 6. Administrator uses these reports to optimize resource utilization and adjust high-level planning.
- Preconditions:
 - Actor is authenticated with Supervisor or Administrator privileges.
 - Project data, task updates, and performance evaluations are stored in the database.
 - The Project Monitoring and Developer Management subsystems are active.

- **Postconditions:**
 - Accurate reports are generated, providing transparency and data-driven insights.
 - System records the report generation activity for audit purposes.
 - Strategic decisions regarding talent allocation can be made based on the report findings.
- **Cross Reference:**
 - R645: Real-time visibility into project progress.
 - R651: Evaluation of developer performance after each project.
 - R676: Recording developer performance to update evaluation scores.
 - R680: Real-time information on project milestones.
- **Alternative Scenarios:**

At Step 3/4: Data Insufficiency

- System detects that a new project or developer has insufficient data to generate a complete report.
- System displays a "Data Pending" message and shows only the available preliminary information.

At Step 5: Report Export Failure

- Actor attempts to download a report, but the system encounters a server error.
- System notifies the Actor of the failure and provides an option to retry or view the report directly on the dashboard.

10) Manage Balance

- UseCase Name: Manage Balance
- Type: Primary / Essential
- Actors: Admin / Accounting / Bank repository
- Description:
 1. Actor logs into the platform and navigates to the "Balance & Earnings" section.
 2. System displays the current balance details for the specific user.
 3. For Administrators/Accounting:
 - System provides a dashboard to monitor the balances of all freelancers.
 - Actor reviews financial transactions and project milestones linked to payments.
 - Actor manually updates or adjusts balances based on finalized project deliverables or internal corrections.
 4. For Developers:
 - System displays the developer's current earnings, pending payments, and historical transaction records.
 - Developer can view how their balance has been updated following the completion and approval of assigned tasks.
 5. System ensures all financial records are securely processed and stored in the database.
- Preconditions:
 - The Actor must be authenticated with either Administrator, Accounting, or Developer privileges.
 - The system's financial database and transaction logging modules must be operational.
 - Relevant projects must have associated financial data or payment records.

- **Postconditions:**
 - User balances are accurately reflected and updated within the system.
 - A secure audit trail of all balance adjustments and financial transactions is maintained.
 - Transparency is maintained between the administration and the development team regarding earnings.
- **Cross Reference: R1, R2, R3**
 - R1: Secure processing and recording of financial transactions.
 - R2: Administrator management and monitoring of freelancer balances.
 - R3: Security measures to protect user data and project information.
 - R4: System reliability in maintaining accurate project and developer scores/data.
- **Alternative Scenarios:**
- **At Step 3: Discrepancy in Task Payment**
 - Developer identifies a missing payment for a completed and approved task.
 - Developer submits a support request through the platform.
 - Administrator/Accounting reviews the task status and updates the balance manually if the claim is valid.
- **At Step 5: Transaction Storage Failure**
 - System fails to record a balance update due to a database error.
 - System triggers an error alert to the Administrator and logs the failed transaction for manual recovery.

UseCase Scenario

Use Case Name	Actor Intention	System Response
Manage Authentication	1. User enters credentials (email/password) to access the platform.	2. System validates credentials against the database.
	3. User selects "Remember Me" or "Forgot Password."	4. System identifies user role (Admin, Client, Employee) and grants access to the specific dashboard.
Order Project	1. Client opens "Order Project" page and fills in Title, Description, Budget, and Deadline.	2. System displays the form and validates that all mandatory fields are filled correctly.
	3. Client uploads project requirement documents.	4. System stores files, generates a unique Project ID, and notifies the Proposal Manager.
Manage Project	1. Developer updates a task status from "Pending" to "In Progress."	2. System updates the project timeline and reflects the change on the Client's dashboard.
	3. Developer marks task as "Completed" and uploads the final code/asset.	4. System records completion time and alerts the Supervisor for review.
Review Quality	1. Supervisor accesses the "Review" queue to inspect developer deliverables.	2. System displays the submitted work along with the original project requirements.
	3. Supervisor approves the work or requests a revision with feedback.	4. System updates the Developer's skill score and notifies them of the result.
Manage Payment	1. Client selects the "Pay Now" option for a specific project milestone.	2. System generates an invoice and presents secure bank-based payment options.

	3. Client confirms the financial transaction.	4. System processes payment, records the transaction, and updates the project funding status.
Manage Employee	1. Admin creates a new profile for a freelancer or adjust role permissions.	2. System updates the user database and sets the initial skill score.
	3. Supervisor reviews a specific developer's workload to balance assignments.	4. System displays active tasks and current performance metrics for that employee.
Manage Training Centers	1. Admin filters for the top 5 developers after a project cycle.	2. System ranks developers by their dynamic skill scores and highlights the top 5.
	3. Admin selects a course from a partner training center to reward a developer.	4. System sends an enrollment invitation and adds the course to the developer's growth record.
Manage Notification	1. User clicks on the notification icon to see recent updates.	2. System displays a list of unread alerts (Assignments, Deadlines, Approvals).
	3. User marks an alert as "Read."	4. System clears the notification badge and archives the message.
Manage Reports	1. Supervisor requests a "Project Progress Report" for a specific client.	2. System aggregates milestone data and generates a real-time progress chart.
	3. Admin requests a "Developer Performance Report."	4. System compiles quality scores and speed metrics into a downloadable PDF/Excel file.
Manage Balance	1. Developer views their "Earnings" tab to see total accumulated income.	2. System calculates the balance from all "Approved" tasks and displays the total.
	3. Admin/Accounting initiates a balance payout or adjustment.	4. System updates the financial ledger and sends a confirmation to the developer.
